PROFESSIONAL SUMMARY

Data engineer with three years across audit analytics and production data platforms. Currently design and run the central data platform at a 500-person UK accountancy firm, consolidating seven business systems into the daily reporting layer finance, operations and the board work from, plus the automated testing that verifies it. Previously two years at RSM validating client financial data across portfolios worth £100M+. Comfortable going deep on SQL, pipeline design and DAX, and equally comfortable explaining the result to non-technical stakeholders.

KEY SKILLS

- **Data Engineering:** SQL, Python, PySpark, Databricks (Delta Lake, Unity Catalog, Workflows), Azure Data Lake, SCD2 and MERGE patterns, API and file ingestion, automated data quality testing, Git and PR review
- **Analytics & BI:** Power BI, DAX and semantic modelling, dimensional modelling, Excel/VBA, statistical sampling, hypothesis and A/B testing
- **AI & Automation:** Microsoft Copilot Studio, Claude API on Azure, RAG, MLflow, agent testing and governance, Power Automate
- **Machine Learning:** scikit-learn, XGBoost, forecasting (ARIMA), anomaly detection, Pandas, NumPy

WORK EXPERIENCE

BKL | London, UK

Nov 2025 – Present

Data & AI Engineer

- Design and run the firm's central data platform on Databricks: seven business systems (practice management, CRM, finance, HR) consolidated into a single daily-refreshed reporting layer of ~216 tables that finance, operations and the board work from.
- Built the firm's automated data quality testing suite: ~980 checks run against every table after each daily refresh, flagging stale data, truncated source pulls, duplicate keys, broken joins and figures that no longer tie back to source. It replaced manual spot-checking and has driven corrections to roughly 30–40% of records across all seven source systems, so figures reaching the C-suite are verified daily rather than trusted.
- Deployed AI agents on Microsoft Copilot Studio to a 100+ person tax department serving 4,000+ clients, cutting typical document preparation from 2–3 days to under 4 hours, and authored the firm's agent testing, risk-tiering and deployment frameworks covering Copilot Studio and a Claude-on-Azure stack.
- Built the reporting layer senior leadership runs on: performance by service line and team, budget against actuals, overdue debt by risk band, and timesheet compliance across 500+ staff, all on one shared model so figures agree wherever they appear. Used daily by the CFO, COO and partners.
- Created a staging environment that mirrors production daily, so pipeline changes are tested against a full copy of real data before release instead of in production, removing the risk of a bad change corrupting live board reporting. Restructured compute alongside it, cutting platform running costs by around 60%.
- Rebuilt budget and actuals reporting for the firm's business units, reconciling every figure back to source in both directions. The process found £8.3m of revenue and £10.5m of cost budget landing in an unmapped bucket, and a £500,000+ work-in-progress misstatement, all corrected before reaching the board pack.
- Integrated the firm's HR system into the platform from scratch, bringing leave, working patterns and joiner/leaver data alongside time and billing for the first time. This underpins capacity planning: available days per person can now be calculated properly rather than assumed, so utilisation and resourcing decisions reflect who was genuinely available to work.

RSM UK | London, UK

Apr 2023 – Sep 2025

Data Analyst – Audit & Advisory

- Worked across 15–20 audit engagements, handling transactional datasets from hundreds of thousands to millions of rows and covering client portfolios worth £100M+.
- Automated reconciliation and transaction flagging in Python and SQL, cutting manual testing time by ~30% and making testing consistent across differently structured client files.
- Ran statistical sampling and hypothesis testing on populations of 100,000+ records; outputs fed directly into audit findings and client-facing reports.
- Built Power BI dashboards for audit teams of 7–20 covering caseload, risk flags and KPIs, cutting reporting turnaround by ~40%.

IIT Bombay | Mumbai, India

Aug 2020 – Jul 2021

Research Assistant

- Built and calibrated MATLAB and Python models simulating plasma expansion in wire-EDM manufacturing, improving prediction accuracy by ~8% against lab measurements; factorial design and sensitivity analysis identified operating ranges with ~10–12% potential energy savings.

EDUCATION

Queen Mary University of London | MSc Advanced Robotics (incl. Machine Learning)

Indian Institute of Technology, Bombay | B.Tech + M.Tech, Mechanical Engineering

LEADERSHIP & INTERESTS

- **Cricket:** 1st XI, North Middlesex CC (Middlesex Premier division); club's top run-scorer and best batter, 2024–25. Captained the IIT Bombay XI, raising win rate from 45% to 80%; Institute Sportsman of the Year.
